

WATERFOWL LURING SYSTEM

ABSTRACT OF THE DISCLOSURE

A waterfowl luring system provides directional motion to one or more waterfowl decoys. The system employs a motor or other force-generating device to rotate a platform to which one or more decoys are attached so that the decoys are moved in relation to rotation of the platform. In operation, the decoys are moved along a substantially circular flight path. The system is highly versatile and may be employed on dry land or in shallow as well as deep water environments.
